Do large-scale battery storage installations need more energy resources?

Large-scale battery storage installations in California need larger energy capacities to qualify as reliability resources, as the California Public Utilities Commission (CPUC) requires generation resources to provide at least four hours of output.

What factors influence battery storage costs besides capital costs?

In addition to the capital costs presented in this section, EIA has observed trends in battery storage costs arising from the negotiated price of electricity for projects that are financed through power purchase agreements (PPAs).

When is stored energy supplied to the grid?

Stored energy is supplied to the grid when both demand and electricity prices are higher. Among the benefits of these co-located projects, the most critical is the ability to take advantage of common onsite infrastructure to store renewable-generated energy produced during periods of low electricity prices and low demand.

Do power purchase agreements affect battery storage costs?

In addition to the capital costs, power purchase agreements (PPAs) can influence battery storage costs. EIA has observed trends in battery storage costs arising from the negotiated price of electricity for projects financed through PPAs.
