Should data centers use microgrids?

As data centers consume more power and electric grids face increasing strain, data center operators are looking for alternatives that do more than provide emergency power. Microgrids offer a potential solution. Microgrids offer on-site generation that integrates renewable energy sources and lowers a facility's carbon footprint.

Are microgrids a viable solution?

Microgrids offer a potential solution. Microgrids offer on-site generation that integrates renewable energy sources and lowers a facility's carbon footprint. They can also optimize energy use while enhancing power stability, reducing reliance on the grid during peak demand when costs are highest.

What is a microgrid & why do we need one?

While backup power systems - typically comprising diesel generators and an uninterruptible power supply - are essential to ensure continuity of service, they are not designed to run continuously. This underscores the value of microgrids, localized energy systems capable of operating independently or in conjunction with the broader electric grid.

Can a microgrid replace a diesel backup system?

Microgrids can replace traditional diesel backup systems with cleaner sources such as natural gas. They also enable data centers to integrate renewable sources, such as solar or wind power, to offset their carbon footprint.
